Executive Summary

The INU internship management system is proposed to address the challenges faced in managing internship programs using traditional manual methods. AT INU the internship process involves many stakeholders including students,departments,colleges,academic directors and external companies. Managing requests,approvals,documents,assessments and reports manually often leads to delays,miscommunication,data loss and lack of transparency.this project aims to provide a centralized and digital solution that simplifies and organizes the entire internship life cycle.

The core idea of the system is to create a single platform where all internship activities can be managed efficiently and securely. Through the system departments can create internship request,higher academic bodies can review and approve them and the students can access internship papers,choose companies and track their progress. Companies are included in the system to review students application and submit assessment and final reports ensuring better collaboration between the university and the industry.
It includes role based access,document management and assessment tracking as key feature. By digitizing the process INU reduces paper work,saves time minimizes errors and improves communication ultimately enhancing efficiency,transparency and academic quality in internship management at INU.

CHAPTRE ONE

INTRODUCTION

Internship is an essential part of student's academic life. It provides an opportunity for students to test the knowledge and skills they have gained in the class room and apply them in real environments.Through internships students evaluate their learning ability,practical performance, and readiness for professional life after graduation. Therefore internships play a vital role in student development and in preparing them for future careers.Like as other universities Injibara university also offer internship opportunities to help students gain practical experience.In this project we aim to reduce the challenges students face during the internship placement process and make the system more efficient and easily accessible

1.1 Back ground of the organization

Injibara university is one of the 4th generation universities in Ethiopia.It is located in Amhara region, Awi zone, in Injibara city. Also it is relatively young institution compared to older universities in the country INU is developing rapidly in both infrastructure and academic programs.

One of the feature that makes Injibara university is its beautiful natural environment. The campus is surrounded by green vegetation, fresh air, and colorful flowers crating a peaceful atmosphere for students and staff. INU offers different academic programs amid at producing skilled graduates who can contribute to community and national development.

As part of its academic requirement students are expected to participate In internship programs to gain practical experience in their field of study. Currently this process is handled manually using paper based communication which leads challenges in tracking, managing placements and maintaining student records. This situation highlights the need for modern computerized system that can support the university in managing student internship more effectively.

1.2 Statement of the problem

The existing internship management system in INU is mainly manual and paper based. Approvals for students internship requests pass through several administrative levels making the process slow, time consuming and prone to information loss.Due to the lack of a centralized and automated system, tracking student placement, company acceptance and internship progress becomes difficult leading to poor communication, delayed decisions and inefficient management.

1.3 Objective of the project

1.3.1 General objective

The general objective of this project is to develop a digital Internship and Industrial Attachment Management System that automates the existing manual process, facilitate efficient approval and placement of students, provides centralized data management and improves communication and monitoring throughout the internship period.

1.3.2 Specific objectives

The specific objective of this project are to:

- To digitalize student internship registration and application processes.
- To enable department and college to review and approve internship requests easily.
- To store and manage student, company and internship related data in a centralized data base.
- To provide an interface for students to submit internship letters,forms and report online.
- To track students' internship status,progress and evaluation during training period.
- To reduce time, paper work and errors that occur in the manual internship management process.
- To enhance communication between students, departments, companies and administration.
- To generate reports and summaries for decision making when needed.

1.4 scope of the project

The project focuses on developing Internship and Industrial Attachment management System for Injibara university.The scope of this system includes:

Department request: the department requests the college to allow students to go for internship.

College review: the college submits the request to the academic director for approval.

***Directorate approva*l**: the academic director or vice president reviews the request consulting with other directors as needed.

College confirmation: If approved the college informs the department provides students with the internship request paper.

Student internship process: Approved students log in using their ID to download request papers and view available companies.

Company approval: students submit the request papers to the companies which then can accept or reject them.

Monitoring: Department track student assignment and manage evaluation.

1.5 Limitations

Although the system aims to improve the internship process there are certain limitations that need to be considered. These are:

- The directorates such as register,finance,library,cafeteria and others which are checked by the academic director are handled manually they are not included in this system.
- The process of selecting students for internship by examination is not included by the system.
- The system does not manage the process that occur after company acceptance including project report,internship report and student evaluation.
- The system depends on internet and device availability with out them the user cannot access them.

1.6 System Development Methodology

1.6.1 System Development Process Model

We find *Agile* process model is appropriate for INU internship management system because it offers:

Incremental and Iterative Delivery: Each increment provides a piece of working module so that the system is usable even when its fully complete.
Continuous Feedback:regular feed back from stakeholder ensures alignment with system goals.

Adaptability: Agile teams can respond quickly to changes in system scope .

Collaboration: Agile team prosper on open communication and collaboration among stakeholders.

1.6.2 System Development Approach

Depending on our system size,clarity of requirement and need for feedback we used Increment Development because:

- Development is divided into small,manageable increments and it makes the system easier to build and test step by step.
- User requirements are prioritised.
- It minimizes the risk.
- It provides flexibility to add new features or change based on evolving requirement.

1.6.3 System Development Tool

We used different tools of software and hardware to develop our system .

From hardware we used:

- ✓ Laptop,desktop(for documentation,design and implementation)
- ✓ Mobile(for accessing data)
- ✓ Paper
- ✓ pen

Form software we used:

- ✓ *WPS OFFICE (for documentation)*
- ✓ *Visual paradigm(for dat modeling)*
- ✓ *MySQL(for database management)*
- ✓ *HTML(front-end development)*
- ✓ *Visual studio code(to write and manage code)*
- ✓ *Postman(for testing APIS)*
- ✓ *Browser Developer Tools(for debugging)*

1.7 Significance Of The Project

The significance of the project is to improve and simplify the workflow of department request processing.Currently the process is manual,time-consuming and prone to errors.By developing an automated system the project will make the request handling process faster,more accurate and more reliable.

1.7.1 Beneficiaries Of The Project

The major beneficiaries of this project are :

1. **Students**

No need to move physically between offices.Easier application for internship.

2. **department**

Easy management of many student applications,Less paper work,faster communication with college ,easy monitoring and reporting.

3. **College Administration**

Clear information about students readiness,faster decision making ,organized approval work flow.

4. **Companies**

Clear details of students assigned,easy submission of evaluation.

5. **University**

Improved efficiency,better data management,transparent internship process.

1.8 Feasibility Study

Feasibility study helps assess whether the proposed INU internship management process can be successfully developed and implemented.it evaluates the project from several perspectives:

1.8.1 Operational feasibility

students will able to apply for internship,department coordinators and college administrators will have more efficient work flow for reviewing,approving and managing internship requests.

Since the system is simplifies daily tasks users are likely to accept adapt it quickly.

So the project is operationally feasible because it improves the work flow and support user's need.

1.8.2 Technical Feasibility

The project is technologically feasible because the working system will be developed by using broadly accessible and reliable technologies such as MY SQL,HTML,VS CODE,PHP,JAVA SCRIBTZ,CSS.
These tools are are free,open source and well supported making them suitable for academic system development.

1.8.3 Legal feasibility

The system does not violet any rules,collects only necessary data and respect privacy.All tools used are legally incensed . There fore the project is legally feasible.

1.8.4 Economic feasibility

The project is economically feasibly because it provides significant benefits at very low cost.
The system minimizes financial cost since most of development tools are free.The current manual internship process request paper,printing, physical transportation and time consuming procedure which create hidden costs.

1.9 Project Schedule

Table 1:project schedule

NO	Task Name	Start date	End date
1	Project planing	14/03/2018	15/03/1018
2	Requirement analysis	16/03/2018	18/03/2018
3	System design	19/03/2018	21/03/2018
4	User unterface design	22/03/2018	23/03/2018
5	Development	24/03//2018	27/03/2018
6	Testing	28/03/2018	03/04/2018
9	Bug fixing	04/04/2018	06/04/2018
10	Deploying the system	07/04/2018	09/04/2018
11	Documentation	10/04/2018	12/04/2018
12	Final submission	13/04/2018	15/04/2018

1.9.1 work breakdown

The team that develops the system has 4 members.And the work break down is shown in the table .

Table 2. work breakdown

NO	Tasks	Team Members
1	Data Gathering	Etsegenet Bimrew And Muhedin Ararso
2	Requirement Analysis	Sewareg Mulat
3	Proposal Writng	Serkalem Abineh
4	Documentation	Muhedin Ararso
5	Project managment	Etsegenet Bimrew

1.9.2 Project Buget

Costs required to develop this project are :

From hardware(laptop)

From software(windows,WPS OFFICE)

CHAPTER TWO

REQUIREMENT ANALYSIS

2.1 Crrent System Discription

The current INU internship management process is handled manually. Students first must be approved by exam to get Internship request paper or to go internship. In the other hand the department sends the request to the college which asks for the permission of students Internship including number of students going for internship and number of teachers visiting the different companies that accept the students for internship then the college sends it to vice president or to academic director then after checking of different directorates the vice president or academic director will allow the students to go the internship and send the acceptance paper to the college and the college will send it to department and the department give request paper to students who are approved to go internship the request paper then

submitted to the company that is available to accept students for Internship.

2.1.1 major function of current system

1. **Student registration:** Capture and maintains records of students eligible for internships.
2. **Exam approval:** Verifies student eligibility by confirming successful completion of required exam.
3. **Request paper issuance:** Issues internship request paper to students who have been approved.
4. **Company assignment:** Submits request papers to companies available to accept students for internships.
5. **Teachers supervision:** Assign teachers to oversee and manage students through out their internship period.
6. **Tracking and reporting:** Monitors the number of students and teachers involved and maintains records of internship progress and completion.

2.1.2 problem of existing system

- ✓ **Too much manual work:** Every thing is done on paper which takes more time.
- ✓ **Frequent mistake**: documents can be lost or filled incorrectly.
- ✓ **No quick update**: students and teachers can not easily track approval or company assignment.
- ✓ **Poor communication**: information moves slowly between students,teachers and companies.
- ✓ **Hard to manage record**s: tracking students and supervising teachers is difficult and unorganized.
- ✓ **Delay in issuing request paper:** students wait longer because the process is not automated.
- ✓ **Limited transparency**: students do not know where their documents are in the process.
- ✓ **Time consuming decision making:** departments need more time to approve students or assign companies.

2.2 Requirement Gathering

Requirement gathering is a way of collecting information to improve or change the existing system by the new system. Requirement is a major base for providing a better solution or for solving problem which exist system.

2.2.1 Requirement gathering methods

Requirement gathering used for development of INU internship management system are:

- **Interviews**

Asking questions to students ,teachers and department staff to understand their needs and problems.

- **observations**

watching how the current internship process works to identify delays,mistake and inefficiencies.

- **Document review**

Studying existing forms,request papers, reports and department guidelines to understand the current workflow.

- **Focus group discussions**

Conducting group discussions with students or teachers to gather detailed requirements and suggestions.

- **Brainstorming**

Team meeting where ideas and requirements are openly discussed to find the best solutions.

2.2.2 Business Rules

A business rule is a statement that controls how the internship management process should work.

- ✧ Only students who pass the exam can receive the request paper and can login to apply for internship.
- ✧ Department staff must log in to send request paper to the college.
- ✧ The college and vice president or academic director must log in to the system to approve the request.
- ✧ Companies must confirm acceptance before a student officially placed.
- ✧ Teachers must report on student progress during the internship.
- ✧ Students must submit an internship report to complete internship.

2.3 Proposed System Description

2.3.1 Overview

The proposed student internship management process is computerized and mobile accessible system designed to manage the internship process efficiently. The system supports students verification,approval,request handling,company coordination and internship monitoring in an integrated manner.

It enables departments,college,academic directors,teachers and companies to collaborate through single system reducing manual work and insuring transparency through out the internship process.

2.3.2 Functional Requirement

Functional requirements are the actions the system should perform to support the internship process.

- The system shall allow users to select their role before logging in.
- The system shall verify the users login details and allow access according to the selected role .
- The system shall restrict system access according to users role allowing each user to access only the functions related to their responsibilities.
- The system allow departments and college login using their CIDR (official institutional code) and password. the academic director or vice president logs in using an official staff ID and password.
- The system shall allow students to register and login by using their ID number and full name.
- The system shall send a login notification with login username and instruction to access the system to the company after student confirms the company acceptance.
- The system verify students approval status when they log in by using their ID number.
- If the student is approved the system shall display the identified college and department to the student for confirmation before proceeding to the next step.
- The system shall allow approved students to download the internship request paper from department with available companies and their email address.
- The system shall allow students to view available companies and send request papers via email .
- The system allow department staff to issue and send request papers to college.
- The system shall allow college to send request to academic director or vice president.
- The system shall allow to send acceptance or rejection of internship request from academic director to college .
- The system shall allow send acceptance or rejection of internship from college to department staff.
- The system shall allow department to send attendance and evaluation file to companies.

- The system shall allow the department to track which students are assigned to which companies
- The system allow the companies to receive internship request and accept or reject students .
- The system shall allow companies to access the system only after accepting a student.
- The shall allow the company which accept students to update attendance and evaluation files.
- The system shall store and manage internship records securely.

2.3.3 Non Functional Requirement

Non functional requirements describe how the system should perform rather than what it does. They focus on quality, performance,security and usability rather than features.

- **Performance**: The system shall process students approval and company responses with in short period of time.
- **Reliability**: The system shall work correctly,consistently and available when ever needed.
- **Security**: Only authorized users (students,department staff,college,academic director and company which accept students) can access their respective functions.
- **Usability**: The system shall have a simple and user friendly interface accessible on both computers and mobile device.
- **Scalability**: The system shall handle multiple students and companies simultaneously with out slowing down.
- **Data Integrity**: All students and internship records shall be stored securely and protected from loss or corruption.
- **Maintainability**: The system shall allow easy updates and modification to accommodate changes in the internship process.

CHAPTER THREE
SYSTEM MODEL

3.1 System Modeling Overview

System modeling is the process of representing and visualizing the structure ,behaviour and data flow of a system before it is implemented. It helps developers and stakeholders understand how the system works,identify potential issues and design it effectively. For INU internship management system we used system different system modelings.

3.2 Use Case Model

A use case mode is a way to represent the functional requirement of a system by showing how users (actors) interact with the system to achieve specific goal .

3.2.1 Identifying Actors

There are 5 actors in our system they are :

1. Student
2. Department staff
3. Colleage
4. Academic Director or vice president
5. Company
6. System
7. Admin

3.2.2 Identifying Usecase

The identified use cases are:

1. Student registration and login
2. Department,college,vice president and company register and login
3. Download internship request paper
4. Submit request paper to company
5. Send internship request from department to college
6. Send internship request from college to academic director
7. Review student clearance and approval
8. The academic director accepts or rejects students internship
9. Company accepts or rejects students
10. Track student-company assignment
11. Send assessment and evaluation paper

12. Notification

3.2.3 Identifying Scenarios

1. Department sends request to college

Actor: Department

Goal: create and send internship request to college

Steps:

1. Department logs into the system
2. Departmebt sends internship request for students
3. System sends it to the college

1. College submit request to VP

Actor: College

Goal: submit internship request received from department

Steps:

1. College receives request from department
2. College logs into the system
3. College submits request to VP for approval

3.VP review and feedback

Actor :vice-president

Goal: Approve or reject internship request

Steps:

1. VP logs in and views request
2. VP approves or rejects a request
3. System sens VP feedback to college

4.College forwards VP feedback to department

Actor: College

Goal: Forward VP feedback to department

Steps:

1. Colleg receives feedback from VP
2. College logs into the system
3. College forwards feedback to department

5.Students status tracking

Actor : Student

Goal : Track progress of internship request

Steps:

1. students logs into the system
2. Confirms college and department
3. Download internship request paper
4. Send the request paper to the company they want from the alternative

6. company acceptance

Goal: Accept student before logging in to the system .

Steps:

1. Company reviews student assignment externally
2. Company acceptance of student via Email
3. Only after accepting the company logs into the system

7.company register and logs into system

Goal: Record acceptance and interact with the system.

Steps:

1. Company logs into the system after accepting students.
2. Company can view assigned student

8.the system sends notification

Goal: To send notification about internship system

Steps:

1. Department create request →notify college
2. College submits to VP→notify VP
3. VP reviews→notify college of feedback
4. College forward feedback→notify department
5. Company confirm to accept student via Email→sends code to company

9.Manages user

Actor: Admin

Goal: To manage system user and access rights

Steps:

1. Admin logs into the system
2. Admin creates or update user accounts
3. Admin assigns roles
4. System saves changes

3.2.4 Identifying Relationship Among Actors and Use case

Table 3: Actor Use Case Table

Actors	Use Case
	Register and login to the system Confirm college and department Download internship request paper View avaliable companies Select accepted company
Department	Register and login to the system Prepare internship reuest Submit interndhip request to college Send assessment and evaluation forms
College	Register and login to the system Review department internship requests Forward requests to academic director View approval decisions
Academic Director/vice-president	Register and login to the system Review internship request Approve or reject internship request
Company	Register and login to the system View students internship request Accept or reject student Submit internship evaluation and report
System	Send notifications
Adim	Register and login Control the user Control the workflow

3.2.5 Use Case Diagram

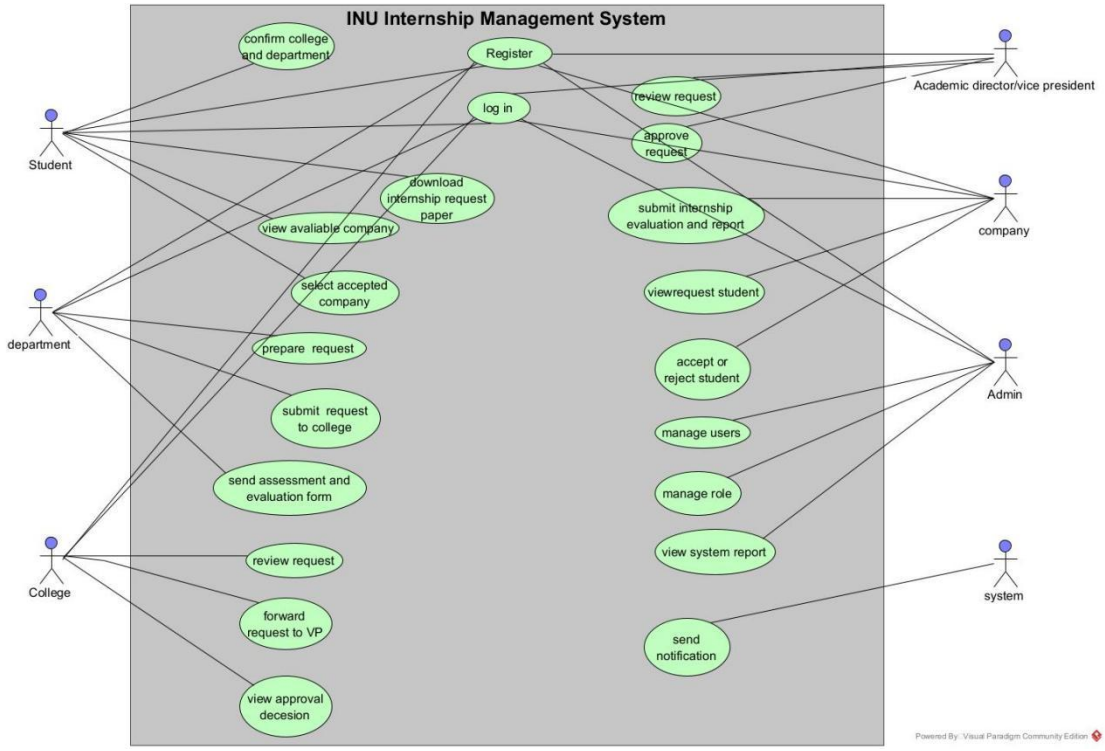

Diagram 1: Use Case Model

3.2.6 Description of use case model

The use case model of the Internship Management System illustrates how different actors interact with the system to manage internship request and approvals. Actors include Department,College,Vice President,Company,Student,Admin and the System. The model shows how requests are initiated,reviewed,approved,confirmed and tracked while the system supports this processes through automation,notification and access control.

3.3 Class Diagram

The class diagram represents the static structure of the Internship Management System. It includes classes such as User,Student,Company,Department,College,academic director and Admin. The diagram shows inheritance,association and responsibilities of each class in managing internship workflows,approvals,notifications and system administration.

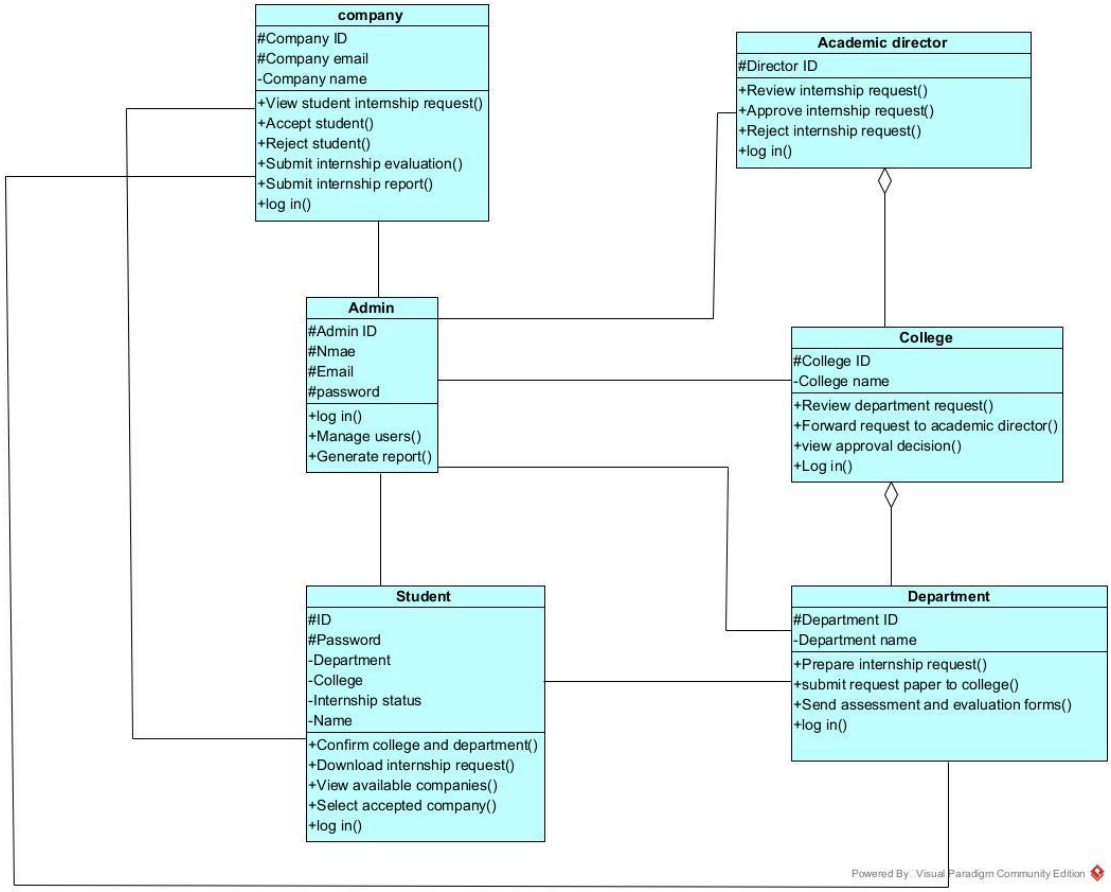

Diagram 2: Class Diagram

3.4 Activity Diagram

An activity diagram shows the step-by-step workflow of activities involved in managing internships from student applying for internship to final approval and evaluation. It shows how different actors interact through actions and decisions to complete the internship process.

The sequence diagram shows the order of interaction between the department,college,academic director,student and company in the internship process from request approval to final reporting.

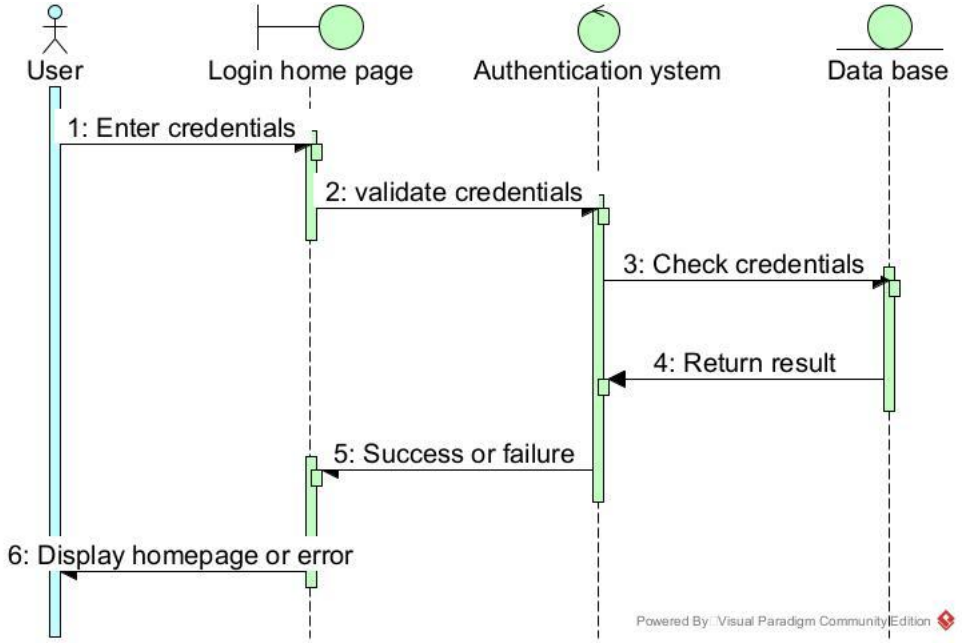

Diagram 4: Sequence Diagram For Login

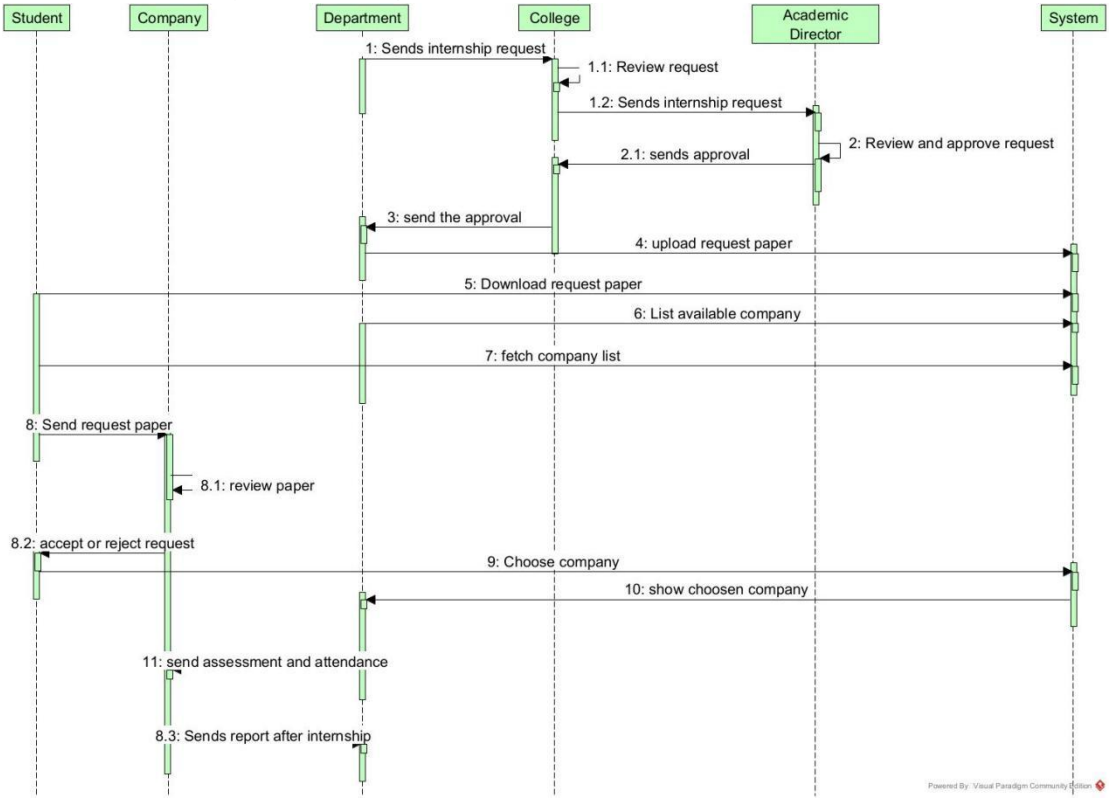

Diagram 5: Sequence Diagram For The System

3.6 User Intrface

The user interface(UI) is part of a system that allows people to interact with it smoothly and efficiently. A good UI guides users through tasks with clear forms,buttons,menus and navigational element making it easy to enter information,access feature and move between screens. It provides immediate feedback and notification so users know were there action succeed or if something needs correction while input validation ensures data accurate. The UI can adapt content dynamically based on the user's role or choices presenting only the information that is relevant to them. Thoughtful visual design including layout,colors and icons help make the interface tentative and pleasant to use while accessibility features ensure that everyone regardless of ability can use the system. Over all the UI acts as friendly bridge between the user and the system making interaction simple,clear and engaging.

The UI enables users interact with internship management system through forms,menus and dashboard. It displays role-based information,provides feedback message and contents users with the system's functions efficiently.

The figures below shows different stages of uses interface for INU internship management system.

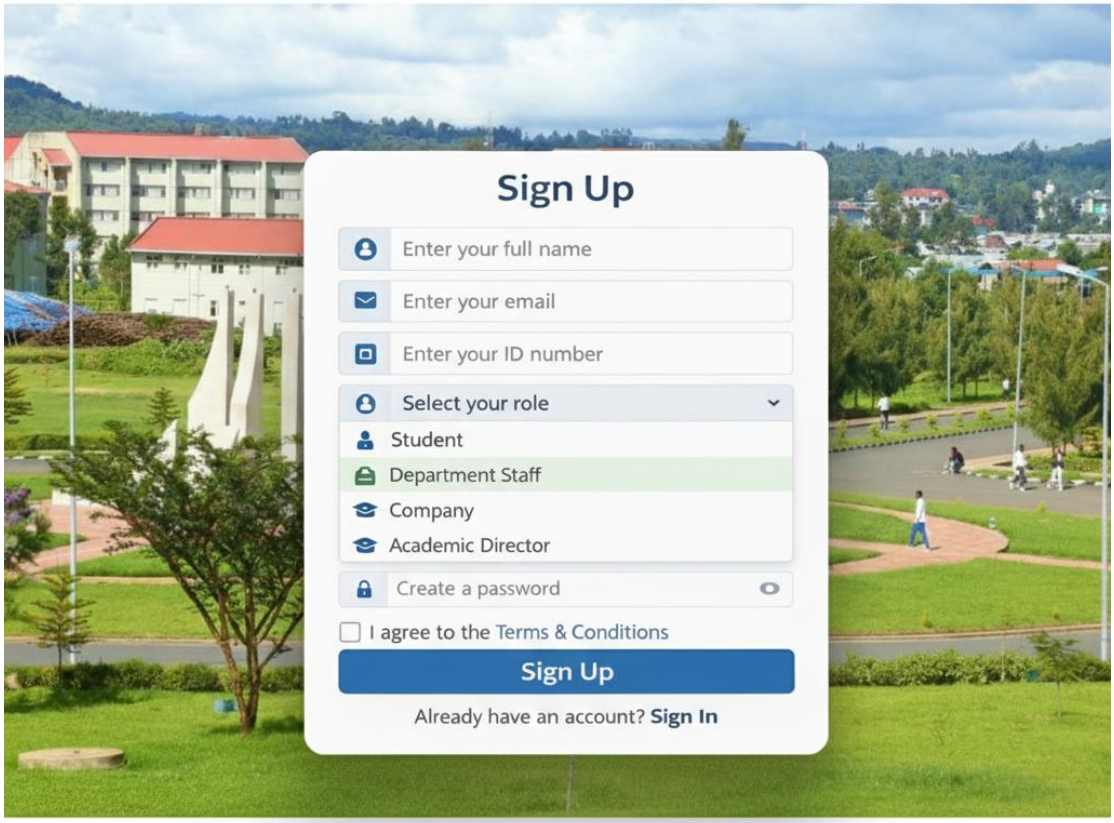

Figure 1: Sign UP User Interface

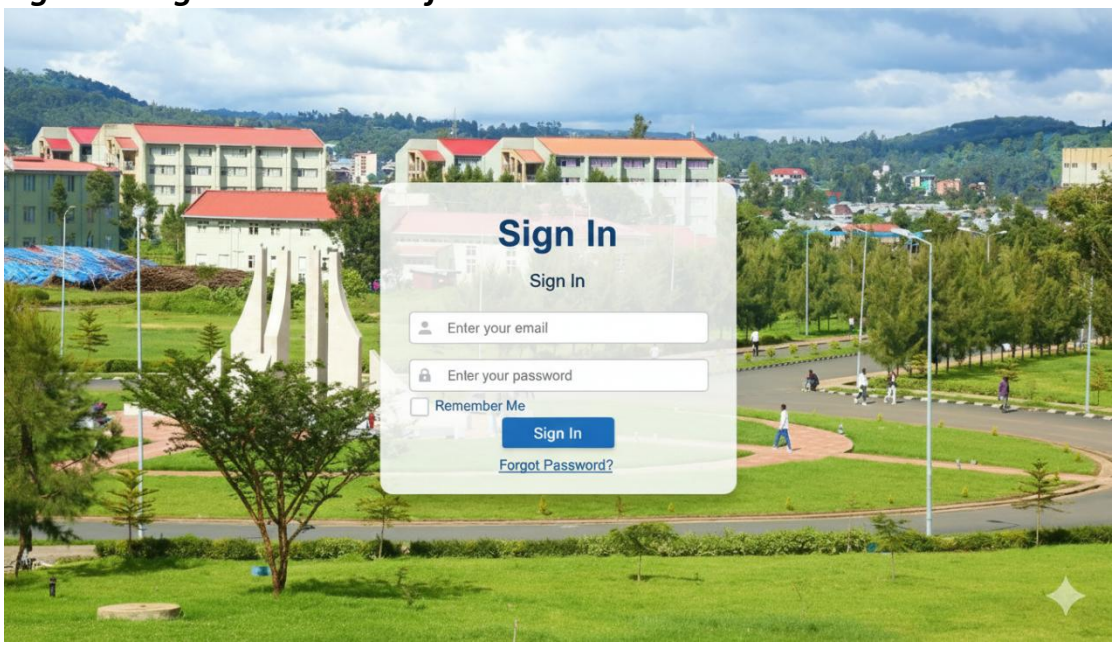

Figure 2: Sign In User Interface

Figure 3: User Dashbord Interface

CHAPTER FOUR
SYSTEM DESIGN

4.1 Introduction

System design is the process of defining how a system will be structured and how it will operate to achieve it's goal. It describes the system architecture main components and the interaction between users,user interfaces,system logic and the database. System design also explains how data flows through the system and how different users role perform their tasks. It is commonly documented using diagrams such as use case,activity,sequence and class. Overall system design provides a clear blueprint that guides system development and ensures the system works efficiently and meets user requirements.

4.2 Current Software Architecture

The current INU internship management system used by university is manual. So there is no software architecture to be described here.

4.3 Proposed Software architecture

Proposed software architecture refers to a planned design of how a software system will be structured and organized before it is actually built. It's essentially a blueprint that shows the key components of the system how they interact and how flows between them.
The proposed structure of INU internship management system is a three-tier architecture a presentation layer for student,companies and admins an application layer that handles internship request,assessment and attendance and a data layer that stores all related information. This setup ensures modularity,security and easy maintenance.

4.3.1 System Decomposition

System decomposition is the process of breaking down a software system in to smaller,manageable components or module showing how each part contributes to the overall system. It helps in understanding,designing and implementing complex system.

- User interface subsystem
- Account management subsytem
- Notification sub system
- Internship management subsystem
- Assessment and ascendance subsystem
- Report subsystem
- Data base subsystem

4.3.2 Deployment Diagram

A deployment diagram shows how the system will be physically deployed across hardware and software nodes. It helps visualize the environment where our internship management system will run including server, database and user device and how they are connected.

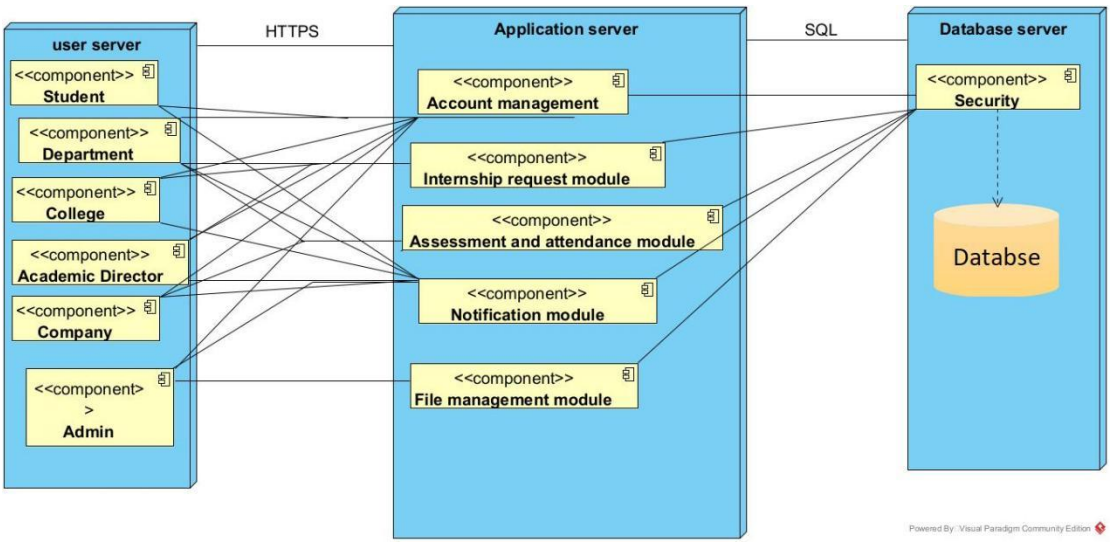

Diagram 5:Deployment Diagram

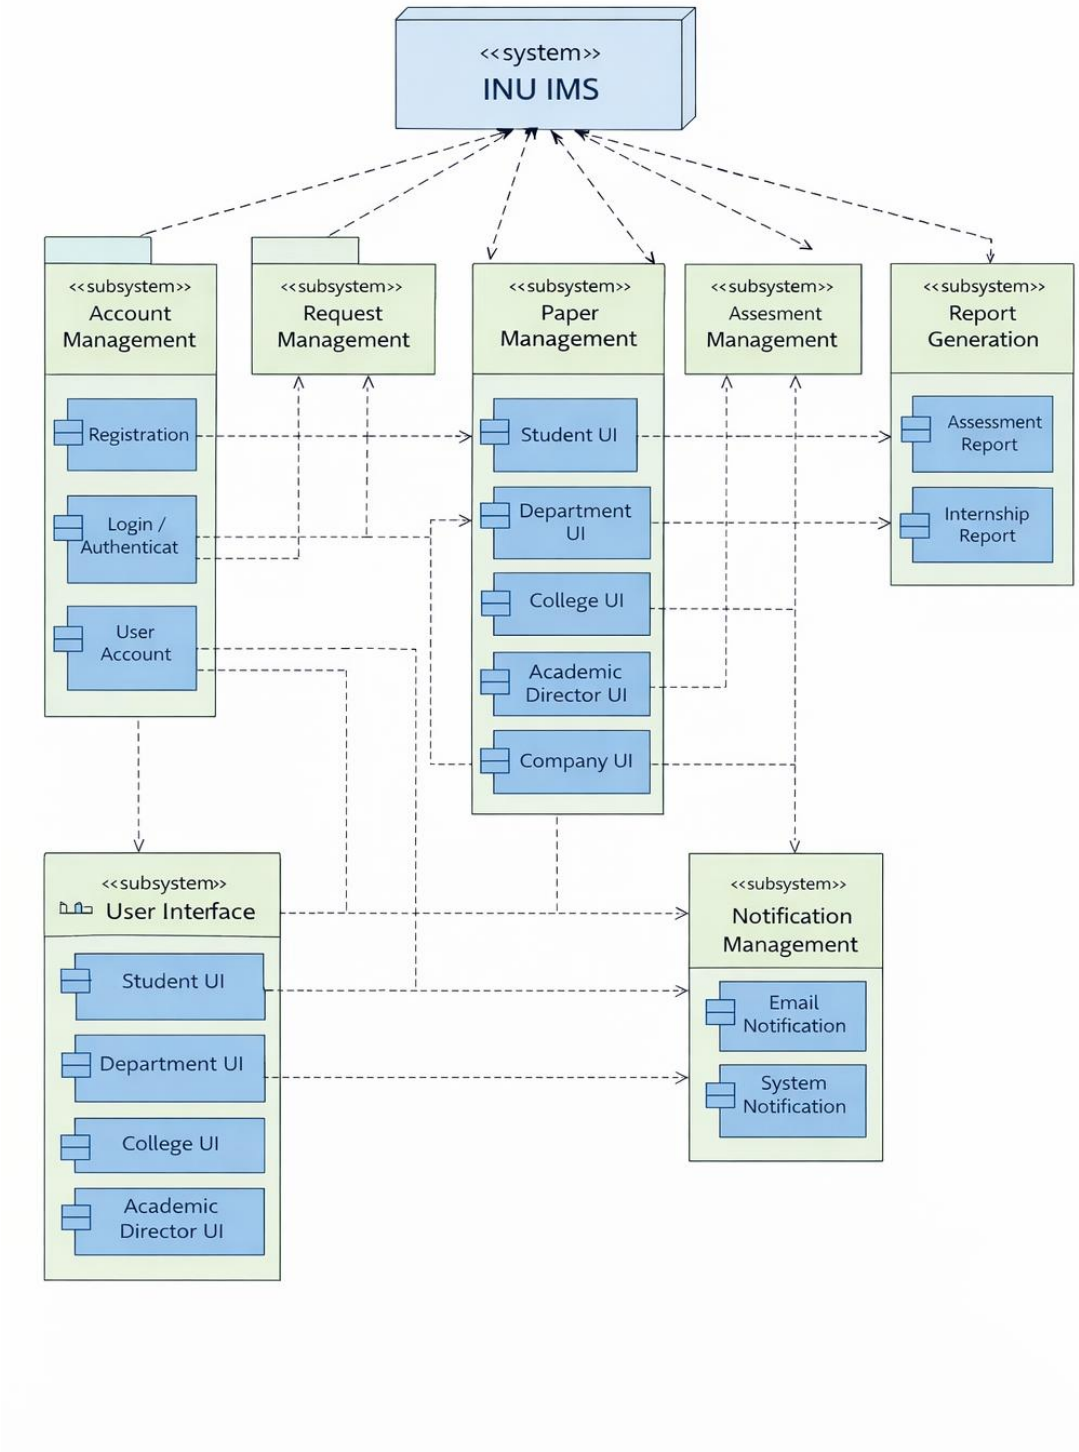

4.3.4 Access Control And Security

The INU internship management system is designed to keep user data safe and protected. The system makes sure that only authorized user can access information and user perform actions. All communication between user and system is secured to prevent unauthorized access. The system uses role based access control meaning each user has access only to what they are allowed to do . students can apply for internship and view their progress,companies can accepts student and submit reports,department and college are review internship request,the VP approve or reject request and admin can manage the entire system. User must login in using username and password. The system checks the user's role after login and allows access only to approved features. All data sent between user and system is protected using HTTPS. User inputs are checked to avoid security problems and inactive sessions are closed automatically. Important actions such as approvals and report submissions are recorded to help monitor the system.

4.3.3 Package Diagram

A package diagram is UML diagram that shows how software system is divided in to packages. It helps to organize the system by grouping related parts together so the system is easier to understand and manage. A package is a collection of related elements such as classes,components work together to perform specific task in the system. Each package focuses on one main responsibility such as user management or internship processing.

Package diagram also show dependencies between package meaning how one package uses relies on another. This makes it clear how different of the system interact with each other. A package diagram helps developers and readers understand high-level structure of the system improves maintainability and supports better system design by keeping responsibility well separated.

CHAPTER FIVE
CONCLUSION AND RECOMMENDATIO

5.1 CONCLUSION

The INU internship management system has been designed to modernize and streamline the internship process at INU replacing the traditional manual system that is often slow,disorganized and prone to errors internship are a crucial part to errors. Internships are a crucial part of student's academic and professional development but managing request,approvals,document exchanges,assessments and reports manually creates many challenges for students,department,college,academic director and external companies. This project addresses these challenges by providing a centralized digital platform that ensures smooth communication,efficient workflows and better tracking of internship activities.

The system allows department to create internship request and forward them foe review while academic director and colleges can approve or reject requests in a timely and organized manner. Students can easily access their internship documents,select companies,while companies can evaluate and submit reports directly through the system. Role based access ensures security,accountability and usability. Furthermore all internship related data including assessment ,attendance and final reports are stored in a structured and reliable manner,reducing the risks of data loss or mismanagement.

In conclusion the INU internship management system successfully achieves its objective of simplifying and improving management of internships. It transforms a traditionally cumbersome and error-prone process into an organized,efficient and transparent system. By providing a reliable platform for all stakeholders,the system enhances productivity,reduces administrative burdens and ensures that students gain meaningful internship experiences. This project demonstrates how technology can be leveraged to support academic and professional development making internship management more effective and sustainable at INU.

5.2 Recommendation

The INU internship management system is recommended for use at INU because it streamlines internship management reduces paperwork and improves communication between students,department,academic directors and companies.the system efficiently handles internship requests,approvals,document exchange and report submission.
While the system already manages assessments and student performance it can be further improved by adding on -site student assessment tracking so instructors can monitor and evaluate students at their companies. Another useful enhancement is clearance management to streamline and approvals from academic directors and other administrative stages.
These improvements will make the system more comprehensive,accountable and easier to manage. Future developers can also add features like advanced reporting or digital verification to further enhance is functionality.
